Perform mini Sprint retrospective

- ○ What went well in the Sprint?
  - ■ Sequential Documentation made each step much more approachable
  - ■ I had a confident understanding of how requirements translate to positive and negative use cases and all the necessary decision tables that correlate to testing use cases
- ○ What went poorly in the Sprint and can be improved next Sprint?
  - ■ **Time Management**: My schedule was off having not created documentation like this before and especially for testing which required a lot of manual resets since preconditions for each test conditions must be met and performing tests changes the underlying data in the application
  - ■ **Issues cascade**: Early on documentation mistakes affected sequential parts in the process. I attempted to list all information and refactor later into proper organization, but refactor was a lot more difficult in Jira than I anticipated and should not be done next sprint.
- ○ What work needs to be done next Sprint?
  - ■ Jira organization and Sub Grouping Defects Better
  - ■ Blocked Testing that is accessible after other Defects are fixed
