1. Present Test Summary Report
   - Planetarium Web Application by Revature Space Initiative for astronomers to track celestial bodies they discover
   - Create Account
   - Login
   - See Planets and Moons Discoveries
   - Add Planets
   - Add Moons
   - Delete Planets
   - Delete Moons
   - ~19 Test Cases, ~60 Data Specific Test Cases
   - Meaningful Discoveries
     - Inability to Login after Account Creation
     - Ability to Delete Other Peoples Moons
2. Showcase Acceptance Testing Summary Report
   - describe 1-3 meaningful discoveries made by your testing
     - Alerts exists all throughout the application but lacks good look of popups and looks unfinished which does not inspire confidence
     - Information about Moon and Planets displays Owner's ID as an number and not the name of the user for planets or the orbiting planet for moons on the Home Page
     - Images about Moons and Planets Don't Scale Well for Different Sized Images and Creates Inconsistency on the Home Page
3. Perform mini Sprint retrospective
   - what went well in the Sprint?
     - Sequential Documentation made each step much more approachable
   - what went poorly in the Sprint?
     - **Time Management**: My schedule was off having not created documentation like this before and especially for testing which required a lot of manual resets since preconditions for each test conditions must be met and performing tests changes the underlying data in the application
     - **Issues cascade**: Early on documentation mistakes affected sequential parts in the process
   - what work needs to be done next Sprint?
     - Jira organization and Sub Grouping Defects Better
     - Blocked Testing that is accessible after other Defects are fixed
4. Field questions
